

ABSTRACT OF DISCLOSURE

A refrigerator having a main body with storing compartments, and doors to open and close openings of the respective storing compartments in a first side of the main body, has: a box accommodating part concaved from the first side of the main body; and an electric component box, which is drawn in and out of the box accommodating part, and includes electric components. With this configuration, the present invention provides the refrigerator allowing the electric component box to be easily drawn in and out and inspected.
